

Gateway API ListenerSet is awesome

Agenda

-
1. Gateway API Overview
 2. ListenerSet
 3. Demo

Gateway API

Entry point into the cluster

Contains all listeners

spec:

gatewayClassName: \$(GatewayClassName)

listeners:

- name: \$(HttpListenerName)

port: 80

protocol: HTTP

allowedRoutes:

namespaces:

from: All

- name: demo-https-listener

port: 443

protocol: HTTPS

hostname: \$(DemoAppUrl)

allowedRoutes:

namespaces:

from: All

tls:

certificateRefs:

- group: ""

kind: Secret

name: \$(DemoAppSecretName)

- name: demo-https-wildcard-listener

port: 443

protocol: HTTPS

hostname: ".*\$(DemoAppUrl)"

allowedRoutes:

namespaces:

from: All

tls:

certificateRefs:

- group: ""

kind: Secret

name: \$(DemoAppPrSecretName)

Gateway API

Entry point into the cluster

Contains all listeners

Management can become challenging for multi-tenant clusters

ListenerSet

"Gateway" managed by teams/developers

Great solution for multi-tenancy → Gateway
does not need to be changed

```
apiVersion: gateway.networking.k8s.io/v1
kind: ListenerSet
metadata:
  name: "${TraefikAppName}-listener"
  namespace: $TraefikNamespace
  annotations:
    cert-manager.io/cluster-issuer: $ClusterIssuerName
spec:
  parentRef:
    group: gateway.networking.k8s.io
    kind: Gateway
    name: $GatewayName
    namespace: $GatewayNamespace
  listeners:
    - name: https-domain
      protocol: HTTPS
      port: 443
      hostname: $TraefikUrl
      tls:
        mode: Terminate
        certificateRefs:
          - name: "${TraefikAppName}-tls-secret"
```

ListenerSet

"Gateway" managed by teams/developers

Great solution for multi-tenancy → Gateway does not need to be changed

Introduced in Gateway API v1.5

Demo
